

Quick recap of last time.

Erasure Codes: Reconstructing a message if some parts of it (packets) are lost.

Idea: Encode n -packet message as a polynomial with n coefficients
 Send values at $n+k$ points if $\leq k$ will be lost
 Reconstruct from what you receive.

The Scheme.

Problem: Communicate n packets m_1, \dots, m_n on noisy channel that corrupts $\leq k$ packets.

Reed-Solomon Code:

1. Make a polynomial, $P(x)$ of degree $n-1$, that encodes message.
 - ▶ $P(1) = m_1, \dots, P(n) = m_n$.
 - ▶ Recall: could encode with packets as coefficients.
2. Send $P(1), \dots, P(n+2k)$.

After noisy channel: Receive values $R(1), \dots, R(n+2k)$.

Properties:

- (1) $P(i) = R(i)$ for at least $n+k$ points i ,
- (2) $P(x)$ is unique degree $n-1$ polynomial that contains $\geq n+k$ received points.

Today's topic.

Error Correction:

Noisy Channel: **corrupts** k packets. (rather than **loss/erasures**.)

Additional Challenge: Finding **which** packets are corrupt.

Properties: proof.

$P(x)$: degree $n-1$ polynomial.

Send $P(1), \dots, P(n+2k)$

Receive $R(1), \dots, R(n+2k)$

At most k i 's where $P(i) \neq R(i)$.

Properties:

- (1) $P(i) = R(i)$ for at least $n+k$ points i ,
- (2) $P(x)$ is unique degree $n-1$ polynomial that contains $\geq n+k$ received points.

Proof:

(1) Easy. Only k corruptions (by assumption).

(2) Degree $n-1$ polynomial $Q(x)$ consistent with $n+k$ points.

$Q(x)$ agrees with $R(i)$, $n+k$ times.

$P(x)$ agrees with $R(i)$, $n+k$ times.

Total points contained by both: $2n+2k$. P Pigeons.

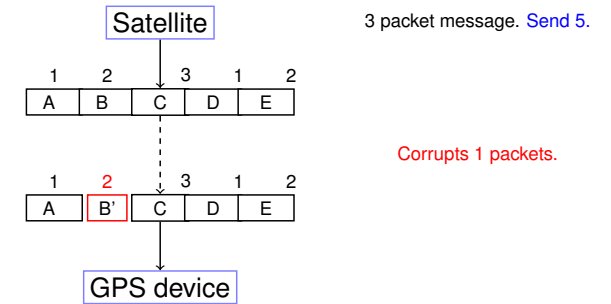

Total points to choose from: $n+2k$. H Holes.

Points contained by both: $\geq n$. $\geq P-H$ Collisions.

$\Rightarrow Q(i) = P(i)$ at n points.

$\Rightarrow Q(x) = P(x)$. □

Error Correction

Example.

Message: 3, 0, 6.

Reed Solomon Code: $P(x) = x^2 + x + 1 \pmod{7}$ has $P(1) = 3, P(2) = 0, P(3) = 6$ modulo 7.

Send: $P(1) = 3, P(2) = 0, P(3) = 6, P(4) = 0, P(5) = 3$.

Receive $R(1) = 3, R(2) = 1, R(3) = 6, R(4) = 0, R(5) = 3$.

$P(i) = R(i)$ for $n+k = 3+1 = 4$ points.

Slow solution.

Brute Force:

For each subset of $n+k$ points

Fit degree $n-1$ polynomial, $Q(x)$, to n of them.

Check if consistent with $n+k$ of the total points.

If yes, output $Q(x)$.

- ▶ For subset of $n+k$ pts where $R(i) = P(i)$, method will reconstruct $P(x)$!
- ▶ For any subset of $n+k$ pts,
 1. there is unique degree $n-1$ polynomial $Q(x)$ that fits n of them
 2. and where $Q(x)$ is consistent with $n+k$ points $\implies P(x) = Q(x)$.

Reconstructs $P(x)$ and only $P(x)$!!

Where can the bad packets be?

$$\begin{aligned} E(1)(p_{n-1} + \dots + p_0) &\equiv R(1)E(1) \pmod{p} \\ 0 \times E(2)(p_{n-1}2^{n-1} + \dots + p_0) &\equiv R(2)E(2) \pmod{p} \\ &\vdots \\ E(m)(p_{n-1}(m)^{n-1} + \dots + p_0) &\equiv R(n+2k)E(m) \pmod{p} \end{aligned}$$

Idea: Multiply equation i by 0 if and only if $P(i) \neq R(i)$.
All equations satisfied!!!!

But which equations should we multiply by 0?

We will use a polynomial!!! One that we don't know... But can find!

Errors at points e_1, \dots, e_k . (In diagram above, $e_1 = 2$.)

Error locator polynomial: $E(x) = (x - e_1)(x - e_2) \dots (x - e_k)$.

$E(i) = 0$ if and only if $e_j = i$ for some j

Multiply equations by $E(\cdot)$. (Above $E(x) = (x-2)$.)

All equations satisfied!!

Example.

Received $R(1) = 3, R(2) = 1, R(3) = 6, R(4) = 0, R(5) = 3$

Find $P(x) = p_2x^2 + p_1x + p_0$ that contains $n+k = 3+1$ points.

All equations..

$$\begin{aligned} p_2 + p_1 + p_0 &\equiv 3 \pmod{7} \\ 4p_2 + 2p_1 + p_0 &\equiv 1 \pmod{7} \\ 2p_2 + 3p_1 + p_0 &\equiv 6 \pmod{7} \\ 2p_2 + 4p_1 + p_0 &\equiv 0 \pmod{7} \\ 1p_2 + 5p_1 + p_0 &\equiv 3 \pmod{7} \end{aligned}$$

Assume point 1 is wrong and solve...**no consistent solution!**
Assume point 2 is wrong and solve...**consistent solution!**

Example.

Received $R(1) = 3, R(2) = 1, R(3) = 6, R(4) = 0, R(5) = 3$

Find $P(x) = p_2x^2 + p_1x + p_0$ that contains $n+k = 3+1$ points.

Plugin points...

$$\begin{aligned} (1-2)(p_2 + p_1 + p_0) &\equiv (3)(1-2) \pmod{7} \\ (2-2)(4p_2 + 2p_1 + p_0) &\equiv (1)(2-2) \pmod{7} \\ (3-2)(2p_2 + 3p_1 + p_0) &\equiv (6)(3-2) \pmod{7} \\ (4-2)(2p_2 + 4p_1 + p_0) &\equiv (0)(4-2) \pmod{7} \\ (5-2)(4p_2 + 5p_1 + p_0) &\equiv (3)(5-2) \pmod{7} \end{aligned}$$

Error locator polynomial: $(x-2)$.

Multiply equation i by $(i-2)$. All equations satisfied!

But don't know error locator polynomial! Do know form: $(x-e)$.

4 unknowns (p_0, p_1, p_2 and e), 5 **nonlinear** equations.

In general..

$P(x) = p_{n-1}x^{n-1} + \dots + p_0$ and receive $R(1), \dots, R(m = n+2k)$.

$$\begin{aligned} p_{n-1} + \dots + p_0 &\equiv R(1) \pmod{p} \\ p_{n-1}2^{n-1} + \dots + p_0 &\equiv R(2) \pmod{p} \\ &\vdots \\ p_{n-1}i^{n-1} + \dots + p_0 &\equiv R(i) \pmod{p} \\ &\vdots \\ p_{n-1}(m)^{n-1} + \dots + p_0 &\equiv R(m) \pmod{p} \end{aligned}$$

Error!! Where???

Could be anywhere!!! ...so try everywhere.

Runtime: $\binom{n+2k}{k}$ possibilities.

Something like $(n/k)^k$...Exponential in k !

How do we find where the bad packets are efficiently?!?!?!?

The General Case.

$$\begin{aligned} E(1)(p_{n-1} + \dots + p_0) &\equiv R(1)E(1) \pmod{p} \\ &\vdots \\ E(i)(p_{n-1}i^{n-1} + \dots + p_0) &\equiv R(i)E(i) \pmod{p} \\ &\vdots \\ E(m)(p_{n-1}m^{n-1} + \dots + p_0) &\equiv R(m)E(m) \pmod{p} \end{aligned}$$

$P(x) = p_{n-1}x^{n-1} + p_{n-2}x^{n-2} + \dots + p_0$

$m = n+2k$ satisfied equations, $n+k$ unknowns. **But nonlinear!**

Let $Q(x) = E(x)P(x) = a_{n+k-1}x^{n+k-1} + \dots + a_0$.

Rewrite the i th equation, for all i , as:

$$Q(i) = R(i)E(i).$$

Note: this is linear in a ; and coefficients of $E(x)$!

Finding $Q(x)$ and $E(x)$?

- ▶ $E(x)$ has degree k ...

$$E(x) = x^k + b_{k-1}x^{k-1} \dots b_0.$$

- ▶ $Q(x) = P(x)E(x)$ has degree $n+k-1$...

$$Q(x) = a_{n+k-1}x^{n+k-1} + a_{n+k-2}x^{n+k-2} + \dots a_0$$

Solving for $Q(x)$ and $E(x)$...and $P(x)$

For all points $1, \dots, i, n+2k$,

$$Q(i) = R(i)E(i) \pmod{p}$$

Gives $n+2k$ linear equations.

$$\begin{aligned} a_{n+k-1} + \dots a_0 &\equiv R(1)(1 + b_{k-1} \dots b_0) \pmod{p} \\ a_{n+k-1}(2)^{n+k-1} + \dots a_0 &\equiv R(2)((2)^k + b_{k-1}(2)^{k-1} \dots b_0) \pmod{p} \\ &\vdots \\ a_{n+k-1}(m)^{n+k-1} + \dots a_0 &\equiv R(m)((m)^k + b_{k-1}(m)^{k-1} \dots b_0) \pmod{p} \end{aligned}$$

..and $n+2k$ unknown coefficients of $Q(x)$ and $E(x)$!

Solve for coefficients of $Q(x)$ and $E(x)$.

Once we have those, compute $P(x)$ as $Q(x)/E(x)$.

Example.

Received $R(1) = 3, R(2) = 1, R(3) = 6, R(4) = 0, R(5) = 3$

$$Q(x) = E(x)P(x) = a_3x^3 + a_2x^2 + a_1x + a_0$$

$$E(x) = x - b_0$$

$$Q(i) = R(i)E(i).$$

$$\begin{aligned} a_3 + a_2 + a_1 + a_0 &\equiv 3(1 - b_0) \pmod{7} \\ a_3 + 4a_2 + 2a_1 + a_0 &\equiv 1(2 - b_0) \pmod{7} \\ 6a_3 + 2a_2 + 3a_1 + a_0 &\equiv 6(3 - b_0) \pmod{7} \\ a_3 + 2a_2 + 4a_1 + a_0 &\equiv 0(4 - b_0) \pmod{7} \\ 6a_3 + 4a_2 + 5a_1 + a_0 &\equiv 3(5 - b_0) \pmod{7} \end{aligned}$$

$a_3 = 1, a_2 = 6, a_1 = 6, a_0 = 5$ and $b_0 = 2$.

$$Q(x) = x^3 + 6x^2 + 6x + 5.$$

$$E(x) = x - 2.$$

Example: Compute $P(x)$.

$$\begin{aligned} Q(x) &= x^3 + 6x^2 + 6x + 5. \\ E(x) &= x - 2. \end{aligned}$$

$$\begin{array}{r} 1 \ x^2 + 1 \ x + 1 \\ \hline x - 2 \) \ x^3 + 6 \ x^2 + 6 \ x + 5 \\ \quad x^3 - 2 \ x^2 \\ \quad \hline \quad 1 \ x^2 + 6 \ x + 5 \\ \quad 1 \ x^2 - 2 \ x \\ \quad \hline \quad \quad x + 5 \\ \quad \quad x - 2 \\ \quad \quad \hline \quad \quad \quad 0 \end{array}$$

$$P(x) = x^2 + x + 1$$

Message is $P(1) = 3, P(2) = 0, P(3) = 6$.

Error Correction: Berlekamp-Welch

Message: m_1, \dots, m_n .

Sender:

1. Form degree $n-1$ polynomial $P(x)$ where $P(i) = m_i$.
2. Send $P(1), \dots, P(n+2k)$.

Receiver:

1. Receive $R(1), \dots, R(n+2k)$.
2. Solve $n+2k$ equations, $Q(i) = E(i)R(i)$ to find $Q(x) = E(x)P(x)$ and $E(x)$.
3. Compute $P(x) = Q(x)/E(x)$.
4. Compute $P(1), \dots, P(n)$, recover the message.

A key question.

Is there one and only one $P(x)$ from Berlekamp-Welch procedure?

Existence: there is a $P(x)$ and $E(x)$ that satisfy equations.

Unique solution for $P(x)$?

Uniqueness: any solution $Q(x)$ and $E'(x)$ have

$$\frac{Q'(x)}{E'(x)} = \frac{Q(x)}{E(x)} = P(x). \quad (1)$$

Proof:

We claim

$$Q'(x)E(x) = Q(x)E'(x) \text{ on } n+2k \text{ values of } x. \quad (2)$$

Equation 2 implies 1:

$Q'(x)E(x)$ and $Q(x)E'(x)$ are degree $n+2k-1$
and agree on $n+2k$ points
 $\implies Q'(x)E(x) = Q(x)E'(x)$.

Cross divide. □

Revisiting last bit.

Claim: $Q'(x)E(x) = Q(x)E'(x)$ on $n+2k$ values of x .

Proof: Construction implies that

$$\begin{aligned} Q(i) &= R(i)E(i) \\ Q'(i) &= R(i)E'(i) \end{aligned}$$

for $i \in \{1, \dots, n+2k\}$.

If $E(i) = 0$, then $Q(i) = 0$. If $E'(i) = 0$, then $Q'(i) = 0$.

$\implies Q(i)E'(i) = Q'(i)E(i)$ holds when $E(i)$ or $E'(i)$ are zero.

When $E'(i)$ and $E(i)$ are not zero

$$\frac{Q'(i)}{E'(i)} = \frac{Q(i)}{E(i)} = R(i).$$

Cross multiplying gives equality in fact for these points. □

Points to polynomials, have to deal with zeros!

Berlekamp-Welch algorithm decodes correctly when at most k errors!

Summary. Error Correction.

Communicate n packets, with k erasures.

How many packets? $n+k$

How to encode? With polynomial, $P(x)$.

Of degree? $n-1$

Recover? Reconstruct $P(x)$ with any n points!

Communicate n packets, with k errors.

How many packets? $n+2k$

How to encode? With polynomial, $P(x)$. Of degree? $n-1$.

Recover?

Reconstruct error polynomial, $E(x)$, and $P(x)$!

Nonlinear equations.

Reconstruct $E(x)$ and $Q(x) = E(x)P(x)$. Linear Equations.

Polynomial division! $P(x) = Q(x)/E(x)$!

Reed-Solomon codes. Berlekamp-Welch Decoding. Perfection!
