CS70: Jean Walrand: Lecture 34.

Continuous Probability 1

1. Examples
2. Events
3. Continuous Random Variables

Uniformly at Random in $[0,1]$.

Choose a real number X, uniformly at random in $[0,1]$.

What is the probability that X is exactly equal to $1/3$? Well, ..., 0.

What is the probability that X is exactly equal to 0.6? Again, 0.

In fact, for any $x \in [0,1]$, one has $Pr[X = x] = 0$.

How should we then describe 'choosing uniformly at random in $[0,1]$'?

Here is the way to do it:

$$Pr[X \in [a,b]] = b - a, \forall 0 \leq a \leq b \leq 1.$$

Makes sense: $b - a$ is the fraction of $[0,1]$ that $[a,b]$ covers.

Uniformly at Random in $[0,1]$.

Let $[a,b]$ denote the **event** that the point X is in the interval $[a,b]$.

$$Pr[[a,b]] = \frac{\text{length of } [a,b]}{\text{length of } [0,1]} = \frac{b-a}{1} = b - a.$$

Intervals like $[a,b] \subseteq \Omega = [0,1]$ are **events.**
More generally, events in this space are unions of intervals.
Example: the event A - "within 0.2 of 0 or 1" is $A = [0,0.2] \cup [0.8,1]$.
Thus,

$$Pr[A] = Pr[[0,0.2]] + Pr[[0.8,1]] = 0.4.$$

More generally, if A_n are pairwise disjoint intervals in $[0,1]$, then

$$Pr[\cup_n A_n] := \sum_n Pr[A_n].$$

Many subsets of $[0,1]$ are of this form. Thus, the probability of those sets is well defined. We call such sets events.

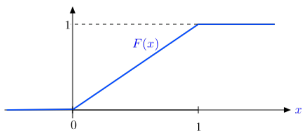
Uniformly at Random in $[0,1]$.

Note: A **radical** change in approach. For a finite probability space, $\Omega = \{1,2,\ldots,N\}$, we started with $Pr[\omega] = p_\omega$. We then defined $Pr[A] = \sum_{\omega \in A} p_\omega$ for $A \subset \Omega$. We used the same approach for countable Ω.

For a continuous space, e.g., $\Omega = [0,1]$, we cannot start with $Pr[\omega]$, because this will typically be 0. Instead, we start with $Pr[A]$ for some events A. Here, we started with A = interval, or union of intervals.

Uniformly at Random in $[0,1]$.

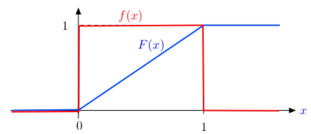
Note: $Pr[X \leq x] = x$ for $x \in [0,1]$. Also, $Pr[X \leq x] = 0$ for $x < 0$ and $Pr[X \leq x] = 1$ for $x > 1$. Let us define $F(x) = Pr[X \leq x]$.



Then we have $Pr[X \in (a,b]] = Pr[X \leq b] - Pr[X \leq a] = F(b) - F(a)$.

Thus, $F(\cdot)$ specifies the probability of all the events!

Uniformly at Random in $[0,1]$.



$$Pr[X \in (a,b]] = Pr[X \leq b] - Pr[X \leq a] = F(b) - F(a).$$

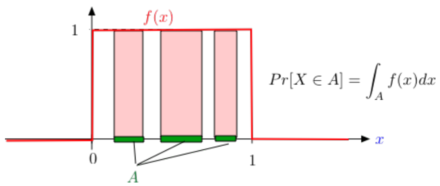
An alternative view is to define $f(x) = \frac{d}{dx}F(x) = 1\{x \in [0,1]\}$. Then

$$F(b) - F(a) = \int_a^b f(x)dx.$$

Thus, the probability of an event is the integral of $f(x)$ over the event:

$$Pr[X \in A] = \int_A f(x)dx.$$

Uniformly at Random in $[0,1]$.



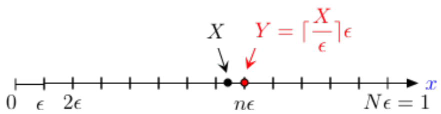
Think of $f(x)$ as describing how
one unit of probability is spread over $[0,1]$: uniformly!

Then $Pr[X \in A]$ is the probability mass over A.

Observe:

- This makes the probability automatically additive.
- We need $f(x) \geq 0$ and $\int_{-\infty}^{\infty} f(x)dx = 1$.

Uniformly at Random in $[0,1]$.



Discrete Approximation: Fix $N \gg 1$ and let $\varepsilon = 1/N$.

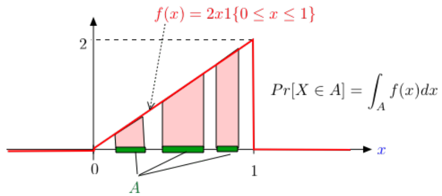
Define $Y = n\varepsilon$ if $(n-1)\varepsilon < X \leq n\varepsilon$ for $n = 1,\dots,N$.

Then $|X - Y| \leq \varepsilon$ and Y is discrete: $Y \in \{\varepsilon, 2\varepsilon, \dots, N\varepsilon\}$.

Also, $Pr[Y = n\varepsilon] = \frac{1}{N}$ for $n = 1,\dots,N$.

Thus, X is 'almost discrete.'

Nonuniformly at Random in $[0,1]$.



This figure shows a different choice of $f(x) \geq 0$ with $\int_{-\infty}^{\infty} f(x)dx = 1$.

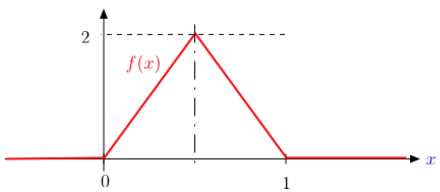
It defines another way of choosing X at random in $[0,1]$.

Note that X is more likely to be closer to 1 than to 0.

One has $Pr[X \leq x] = \int_{-\infty}^{x} f(u)du = x^2$ for $x \in [0,1]$.

Also, $Pr[X \in (x, x+\varepsilon)] = \int_x^{x+\varepsilon} f(u)du \approx f(x)\varepsilon$.

Another Nonuniform Choice at Random in $[0,1]$.



This figure shows yet a different choice of $f(x) \geq 0$ with $\int_{-\infty}^{\infty} f(x)dx = 1$.

It defines another way of choosing X at random in $[0,1]$.

Note that X is more likely to be closer to $1/2$ than to 0 or 1.

For instance, $Pr[X \in [0,1/3]] = \int_0^{1/3} 4x dx = 2\left[x^2\right]_0^{1/3} = \frac{2}{9}$.

Thus, $Pr[X \in [0,1/3]] = Pr[X \in [2/3,1]] = \frac{2}{9}$ and $Pr[X \in [1/3,2/3]] = \frac{5}{9}$.

General Random Choice in $\Re$

Let $F(x)$ be a nondecreasing function with $F(-\infty) = 0$ and $F(+\infty) = 1$.

Define X by $Pr[X \in (a,b]] = F(b) - F(a)$ for $a < b$. Also, for $a_1 < b_1 < a_2 < b_2 < \cdots < b_n$,

$$\begin{aligned} &Pr[X \in (a_1,b_1] \cup (a_2,b_2] \cup (a_n,b_n]] \\ &= Pr[X \in (a_1,b_1]] + \cdots + Pr[X \in (a_n,b_n]] \\ &= F(b_1) - F(a_1) + \cdots + F(b_n) - F(a_n). \end{aligned}$$

Let $f(x) = \frac{d}{dx}F(x)$. Then,

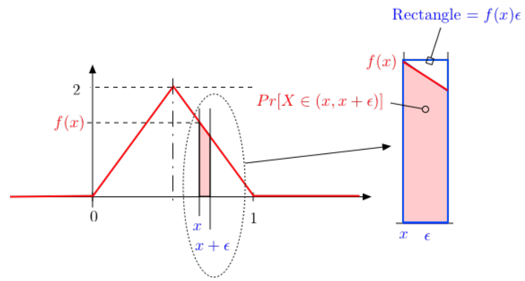
$$Pr[X \in (x, x+\varepsilon]] = F(x+\varepsilon) - F(x) \approx f(x)\varepsilon.$$

Here, $F(x)$ is called the cumulative distribution function (cdf) of X and $f(x)$ is the probability density function (pdf) of X.

To indicate that F and f correspond to the RV X, we will write them $F_X(x)$ and $f_X(x)$.

$Pr[X \in (x, x+\varepsilon)]$

An illustration of $Pr[X \in (x, x+\varepsilon)] \approx f_X(x)\varepsilon$:



Thus, the pdf is the 'local probability by unit length.'

It is the 'probability density.'

Discrete Approximation

Fix $\varepsilon \ll 1$ and let $Y = n\varepsilon$ if $X \in (n\varepsilon, (n+1)\varepsilon]$.

Thus, $Pr[Y = n\varepsilon] = F_X((n+1)\varepsilon) - F_X(n\varepsilon)$.

Note that $|X - Y| \leq \varepsilon$ and Y is a discrete random variable.

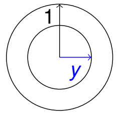
Also, if $f_X(x) = \frac{d}{dx}F_X(x)$, then $F_X(x+\varepsilon) - F_X(x) \approx f_X(x)\varepsilon$.

Hence, $Pr[Y = n\varepsilon] \approx f_X(n\varepsilon)\varepsilon$.

Thus, we can think of X of being almost discrete with $Pr[X = n\varepsilon] \approx f_X(n\varepsilon)\varepsilon$.

Example: CDF

Example: hitting random location on gas tank.
Random location on circle.



Random Variable: Y distance from center.
Probability within y of center:

$$\begin{aligned} Pr[Y \leq y] &= \frac{\text{area of small circle}}{\text{area of dartboard}} \\ &= \frac{\pi y^2}{\pi} = y^2. \end{aligned}$$

Hence,

$$F_Y(y) = Pr[Y \leq y] = \begin{cases} 0 & \text{for } y < 0 \\ y^2 & \text{for } 0 \leq y \leq 1 \\ 1 & \text{for } y > 1 \end{cases}$$

Calculation of event with dartboard..

Probability between .5 and .6 of center?
Recall CDF.

$$F_Y(y) = Pr[Y \leq y] = \begin{cases} 0 & \text{for } y < 0 \\ y^2 & \text{for } 0 \leq y \leq 1 \\ 1 & \text{for } y > 1 \end{cases}$$

$$\begin{aligned} Pr[0.5 < Y \leq 0.6] &= Pr[Y \leq 0.6] - Pr[Y \leq 0.5] \\ &= F_Y(0.6) - F_Y(0.5) \\ &= .36 - .25 \\ &= .11 \end{aligned}$$

PDF.

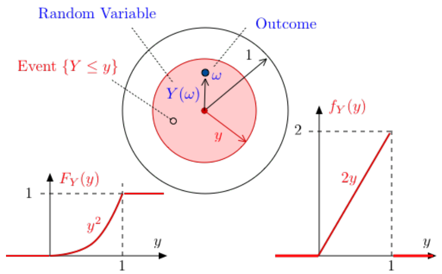
Example: "Dart" board.
Recall that

$$F_Y(y) = Pr[Y \leq y] = \begin{cases} 0 & \text{for } y < 0 \\ y^2 & \text{for } 0 \leq y \leq 1 \\ 1 & \text{for } y > 1 \end{cases}$$

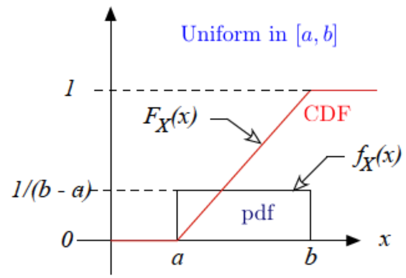
$$f_Y(y) = F'_Y(y) = \begin{cases} 0 & \text{for } y < 0 \\ 2y & \text{for } 0 \leq y \leq 1 \\ 0 & \text{for } y > 1 \end{cases}$$

The cumulative distribution function (cdf) and probability distribution function (pdf) give full information.
Use whichever is convenient.

Target



$U[a,b]$

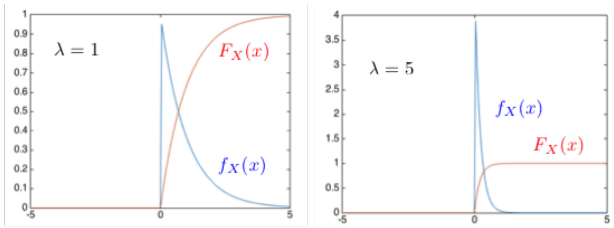


$Expo(\lambda)$

The exponential distribution with parameter $\lambda > 0$ is defined by

$$f_X(x) = \lambda e^{-\lambda x} 1\{x \geq 0\}$$

$$F_X(x) = \begin{cases} 0, & \text{if } x < 0 \\ 1 - e^{-\lambda x}, & \text{if } x \geq 0. \end{cases}$$



Note that $Pr[X > t] = e^{-\lambda t}$ for $t > 0$.

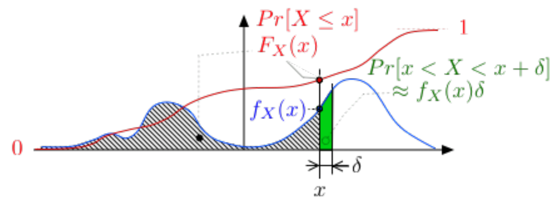
Random Variables

Continuous random variable X, specified by

1. $F_X(x) = Pr[X \leq x]$ for all x.
   Cumulative Distribution Function (cdf).
   $Pr[a < X \leq b] = F_X(b) - F_X(a)$
   1.1 $0 \leq F_X(x) \leq 1$ for all $x \in \Re$.
   1.2 $F_X(x) \leq F_X(y)$ if $x \leq y$.
2. Or $f_X(x)$, where $F_X(x) = \int_{-\infty}^{x} f_X(u)du$ or $f_X(x) = \frac{d(F_X(x))}{dx}$.
   Probability Density Function (pdf).
   $Pr[a < X \leq b] = \int_a^b f_X(x)dx = F_X(b) - F_X(a)$
   2.1 $f_X(x) \geq 0$ for all $x \in \Re$.
   2.2 $\int_{-\infty}^{\infty} f_X(x)dx = 1$.

Recall that $Pr[X \in (x, x+\delta)] \approx f_X(x)\delta$. Think of X taking discrete values $n\delta$ for $n = \ldots, -2, -1, 0, 1, 2, \ldots$ with $Pr[X = n\delta] = f_X(n\delta)\delta$.

A Picture



The pdf $f_X(x)$ is a nonnegative function that integrates to 1.

The cdf $F_X(x)$ is the integral of f_X.

$$Pr[x < X < x + \delta] \approx f_X(x)\delta$$

$$Pr[X \leq x] = F_x(x) = \int_{-\infty}^{x} f_X(u)du$$

Summary

Continuous Probability 1

1. pdf: $Pr[X \in (x, x+\delta]] = f_X(x)\delta$.
2. CDF: $Pr[X \leq x] = F_X(x) = \int_{-\infty}^{x} f_X(y)dy$.
3. $U[a,b]$: $f_X(x) = \frac{1}{b-a} 1\{a \leq x \leq b\}; F_X(x) = \frac{x-a}{b-a}$ for $a \leq x \leq b$.
4. $Expo(\lambda)$:
   $f_X(x) = \lambda \exp\{-\lambda x\} 1\{x \geq 0\}; F_X(x) = 1 - \exp\{-\lambda x\}$ for $x \leq 0$.
5. Target: $f_X(x) = 2x1\{0 \leq x \leq 1\}; F_X(x) = x^2$ for $0 \leq x \leq 1$.
